SELECTED WORKS

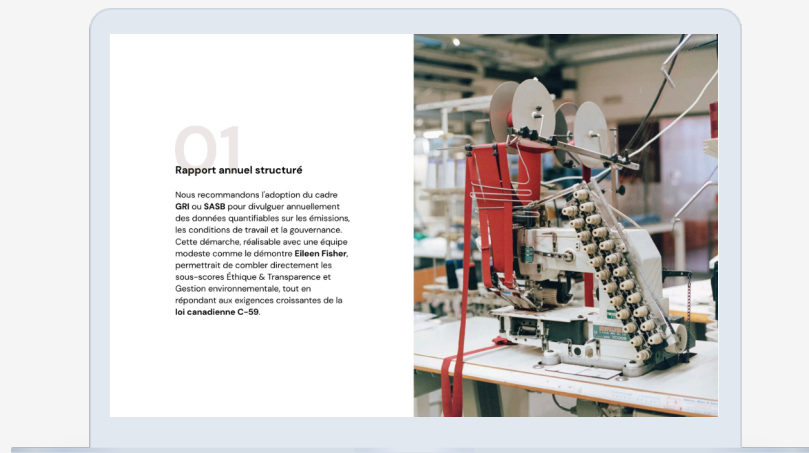

KOTN

Kotn is a Canadian apparel company with manufacturing operations located along the Nile Delta valley in Egypt.

In the context of a graduate sustainability course at HEC Montréal (DDRS 40403), our team conducted research into Kotn's environmental and social impact, digging into on-the-ground realities such as Egypt's broader water crisis.

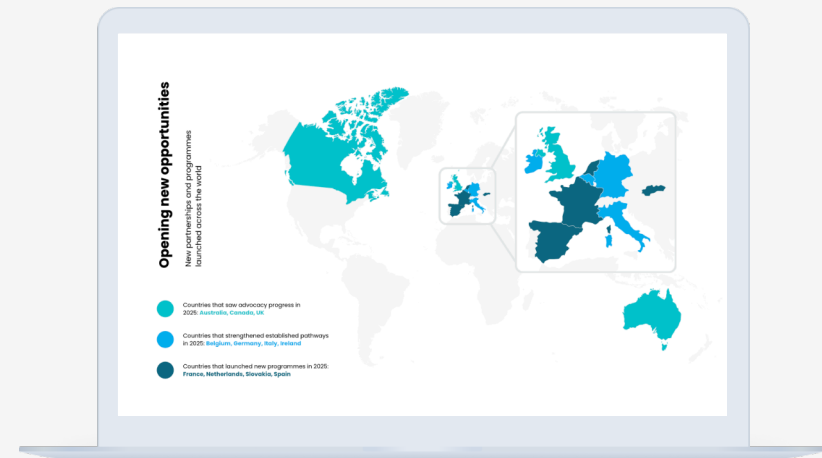

The end-of-semester project culminated in a presentation showcasing our short-term and longer-term risk management strategy for the growing company.

TALENT BEYOND BOUNDARIES

Talent Beyond Boundaries is an international non-profit organization that provides labor mobility solutions for skilled & educated refugees worldwide.

For this project, I designed a series of infographic maps using Adobe Illustrator. The goal was to visually outline the NGO's efforts & achievements in Europe and to integrate the design(s) into their 2025 annual report. Complemented by a monochrome, minimalist layout, the brand's triad of blues was used alongside a Poppins font.

LE FRENCH SIDE DE MCGILL

Developed by McGill's School of Continuing Studies, Le French Side de McGill (now discontinued) aimed to promote French language, culture and events across campus.

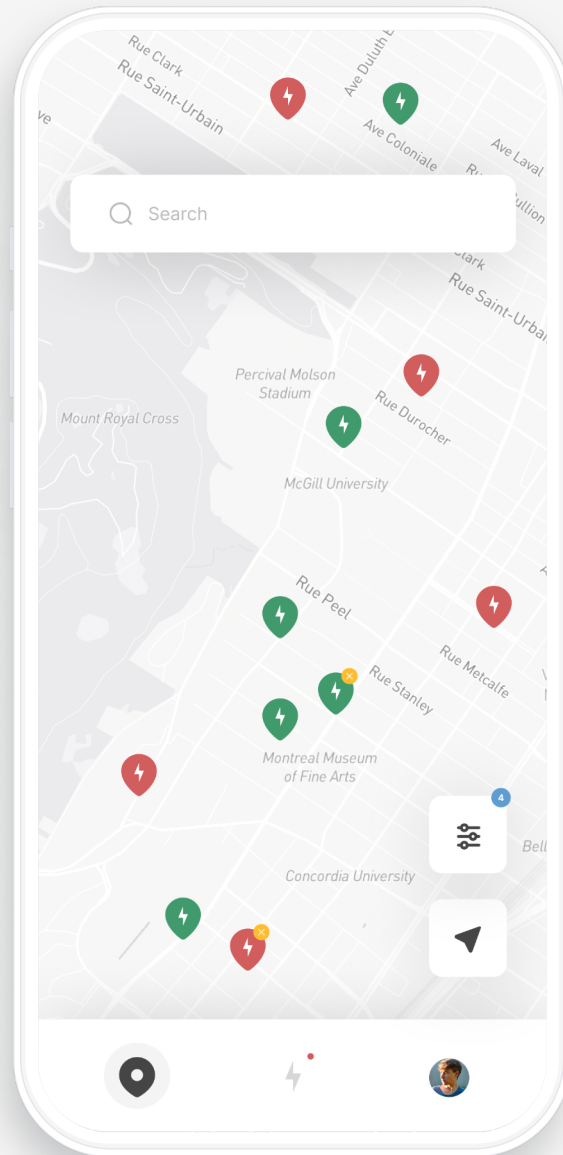

During my contract at McGill, I was responsible for managing the initiative's social media accounts, both on Facebook and Instagram. Content included contests, photos of events, portraits of students, news, nominations, collaborations, and more.

LES FRUITS DÉFENDUS

Les Fruits Défendus is a local, Montreal-based collective that connects volunteer fruit-pickers with tree-owners to fight food insecurity.

In the context of a graduate UX Design course at HEC Montréal (TECH 60704), our team conducted an end-to-end UX research cycle of the organization's website. Through card sorting studies, user interviews, and comparative analyses, we built a robust design system rooted in accessibility and a testable prototype hosted on GitHub, all of which was showcased live during a final presentation.

CHARGEHUB

ChargeHub is a Montreal-based startup that provides charging solutions for EV drivers across North America.

For this end-of-semester analytics project, our team was tasked with evaluating ChargeHub's Google Analytics data and providing strategic recommendations. Given the poor usability and interface of the company's app (validated through user interviews), prototypes were built in Figma to visually showcase potential improvements.
